

Regulating Loot Boxes as Gambling? Towards a Combined Legal and Self-Regulatory Consumer Protection Approach

Abstract

Loot boxes represent a popular and prevalent contemporary monetisation innovation in video games that offers the purchasing player-consumer, who always pays a set amount of money for each attempt, the opportunity to obtain randomised virtual rewards of uncertain in-game and real-world value. Loot boxes have been and continue to be scrutinised by regulators and policymakers because their randomised nature is akin to gambling. The regulation of loot boxes is a current and challenging international public policy and consumer protection issue. This paper reviews the psychology literature on the *potential* harms of loot boxes and applies the behavioural economics literature in order to identify the potentially abusive nature and harmful effects of loot boxes, which justify their regulation. This paper calls on the industry to publish loot box spending data and cooperate with independent empirical research to avoid overregulation. By examining existing regulation, this paper identifies the flaws of the ‘regulate loot boxes as gambling’ approach and critiques the alternative consumer protection approach of adopting ethical game design, such as disclosing the probabilities of obtaining randomised rewards and setting maximum spending limits. This paper recommends a combined legal and self-regulatory approach: the law should set out minimal acceptable standards of consumer protection and industry self-regulation should thrive to achieve an even higher standard.

1. Introduction

‘Loot boxes’ are consumable virtual items in video games that can be redeemed (or ‘opened’) by players to receive randomised rewards, which may be merely cosmetic, or which may influence the game more significantly by unlocking additional game content or manipulating the player’s in-game power. This paper adopts a wide interpretation of the meaning of ‘loot boxes’ to include other randomised monetisation methods in video games which may not necessarily be represented as a ‘box:’ for example, treasure chests; military supply crates; card packs; gacha prize dispensers; and prize wheels. In some games, these rewards may be transferable between players and accordingly gain real-world monetary value.¹ Randomised game mechanics in general are arguably inherent to game design and have been implemented in video games for decades.² However, paid loot boxes specifically, *i.e.*, loot boxes that require the payment of real-world money to obtain (rather than loot boxes that are obtained ‘for free’ by completing in-game tasks, such as defeating enemies³) is a relatively recent monetisation innovation that has been

³ Non-paid loot boxes have been hypothesised to also be potentially harmful by normalising gambling behaviour, especially in relation to children, see Xiao, ‘Which Implementations of Loot Boxes Constitute Gambling?’ (n 1). However, the empirical basis for this assertion remains to be established; therefore, this paper focuses on paid loot boxes.

the subject of public controversy⁴ and regulatory scrutiny⁵ due to its randomised nature and apparent similarity to gambling.

1.1. History and commercial background

The origin of the loot box mechanic can be traced back to the collectible and tradable sports cards of the mid-twentieth century.⁶ Loot boxes were inspired by the successful monetisation of *Magic: The Gathering* (1993, Wizards of the Coast), a tabletop trading card game,⁷ which, instead of selling a complete collection of every available card to its players, sells blind sealed packages of randomised cards of varying power and value that forces players to effectively purchase duplicate cards, and thereby spend more money than they otherwise would have to, in order to obtain a complete collection.⁸ *Magic: The Gathering* has relied upon and sustained itself on this same lucrative business model through to the present day.

The initial digital implementations of loot boxes were in free-to-play games on mobile phones that relied solely on paid loot boxes to monetise, e.g., *Puzzle & Dragons* (2012, GungHo Online Entertainment). Such games adopt the ‘freemium’ business model: instead of directly selling all of their content outright, they offer a

portion of their content to players for free as an alternative business strategy in order to attract the largest possible userbase, and then monetised by convincing a portion of that userbase they have attracted to make optional 'premium' in-game purchases and unlock more content.⁹ However, loot boxes are now also commonly implemented in full-priced games on consoles and PCs, e.g., *Overwatch* (2015, Blizzard Entertainment).¹⁰ Such games originally monetised based solely on title sales, but now also implement loot boxes as an additional, supplementary monetisation method.

The adoption of alternative monetisation methods, such as implementing loot boxes, is a highly successful attempt by the video game industry to respond to commercial pressures within the rapidly developing but hypercompetitive industry,¹¹ such as meeting consumer pressures to keep title prices low despite increasing production costs; rampant piracy facilitated by illegal online file-sharing, including torrenting, that digital rights management (DRM) has failed to prevent technologically; and the pressing need for less-established game companies to explore alternative business models and user acquisition methods, such as freemium, in an over-saturated market.¹² The prevalent implementation of loot boxes reflects a change in the business model of many video games to rely significantly on 'microtransactions:' this transition can be conceptualised as 'game as a service,' which will be provided and paid for segmentally and periodically over a length of

⁹ Some free-to-play games' content can potentially be accessed entirely for free if the player is willing to invest significant amounts of their time.

time (e.g., subscription-based monthly 'battle pass' systems), as compared to the traditional 'game as a product' conceptualisation by which a game was provided and sold at once as a complete package. This change brings positive effects to consumers, such as increased accessibility to gaming products, and the freedom to choose to pay for video gaming services in manners more suitable to the consumer's own financial situation and desired amount of dedication to a particular game.¹³ Nonetheless, the widespread implementation of paid loot boxes in video games is concerning.

1.2. Statistics: prevalence; engagement; total spending and individual spending

Loot boxes are currently prevalent in video games; are purchased by a significant percentage of players; and are deemed suitable for purchase by children. Macey and Hamari concluded that loot boxes are presently 'prevalent in all types and genres of contemporary video games'¹⁴ and that their purchase is widely popular with esports participants across all age groups (46.2% of those surveyed purchased loot boxes).¹⁵ Zendle et al.'s survey of the UK games market found that 56% of top-grossing mobile games on Apple and Android, and 36% of top-grossing desktop games on Steam, contained loot boxes, and that 93% of Android games containing loot boxes were deemed suitable for children aged 12+ and 57% were also deemed suitable for children aged 7+.¹⁶ The UK Gambling Commission's 2019

survey found that 28.1% of 11–16-year-olds in the UK have used in-game items and 22.9% have paid money to open loot boxes.¹⁷

Conclusive data on loot box spending (either total or per individual player) cannot be collated because such data is held by game companies and they do not release loot box sales data to the public. Juniper Research predicted that total spending on loot boxes and ‘skins gambling’ (i.e., gambling on, *inter alia*, eSports tournament results using in-game cosmetic items, including those obtained from loot boxes¹⁸) will rise from under US\$30 billion (≈£22.9 billion) in 2018 to US\$50 billion (≈£38.2 billion) in 2022.¹⁹ Approximately 20% of all surveyed *Heroes of the Storm* (2015, Blizzard Entertainment) players were classified as problem gamblers on the Problem Gambling Severity Index (PGSI):²⁰ such players were documented to have individually spent on average US\$83.86 (≈£64) monthly on the loot boxes of just this one game.²¹ Players may well be invested in and playing multiple games simultaneously, and therefore spending money buying loot boxes in multiple games. Therefore, actual monthly individual spending on loot boxes may be many times more than Zendle’s findings. Indeed, mainstream media has reported extreme cases, demonstrating public attention to the issue: four children spent ‘nearly £550 in three

¹⁷ UK Gambling Commission, ‘Young People and Gambling Survey 2019: A Research Study among 11-16 Year Olds in Great Britain’ (2019) 39 <www.gamblingcommission.gov.uk/PDF/Young-People-Gambling-Report-2019.pdf> accessed 3 August 2020.

¹⁸ Skins gambling is another gambling-related video game issue that should be addressed either by law or self-regulation to ensure consumer protection, especially in relation to vulnerable groups, such as children. The psychology literature on loot boxes, and how loot boxes will be addressed by the industry and by regulators, may inform the regulation of skins gambling. However, skins gambling is not within the ambit of this paper.

weeks' on loot boxes using their father's bank account without permission and still failed to get the rare item they were after.²² Another player discovered that he has 'spent over US\$10,000 [(≈£7642)] in just two years' on the loot boxes of one single game by requesting his personal data from the game company using data protection legislation;²³ this latter case also demonstrates that game companies have indeed collected and are in possession of data on individual players' loot box spending.

The statistics cited demonstrate that the video game industry has a significant financial interest in loot boxes and may be incentivised to ensure their continued unregulation, and that the regulation of loot boxes is a substantial issue that impacts many people across the world, including vulnerable groups, such as children. Accordingly, the regulation of loot boxes may be justifiable to prevent potential gambling-related harms and, regardless of any contravention of gambling laws, to ensure consumer protection in general.

2. Potential harm: perspectives from psychology and behavioural economics

Loot boxes are structurally similar to gambling because they possess elements in common with gambling and satisfy Griffiths' definition of gambling in psychology.²⁴ The purchase of loot boxes has been identified as an 'emergent

See Mark D Griffiths, *Adolescent Gambling* (Routledge 1995) 1–2. A wider interpretation of 'gambling' may conclude that an even higher proportion of loot boxes are structurally similar to gambling, see Leon Y Xiao, 'Conceptualising the Loot Box Transaction as a Gamble Between the Purchasing Player and the Video Game Company' (2020) *Advance online publication. International Journal of Mental Health and Addiction* <doi.org/10.1007/s11469-020-00328-7> accessed 3 August 2020.

gambling behaviour.²⁵ The randomised nature of loot boxes is arguably designed to encourage purchase in manners similar to gambling.²⁶ Certain implementations of loot boxes may be ‘predatory’ because they ‘disguise or withhold the true long-term cost of the activity until players are already financially and psychologically committed.’²⁷

2.1. Link between problem gambling and loot boxes

Zendle and Cairns’ large-scale survey, based on the players’ self-reported quantitative measures of the intensity of their problem gambling on the Problem Gambling Severity Index (PGSI), demonstrated ‘an important relationship between problem gambling and the use of loot boxes,’²⁸ which is that: ‘[t]he more severe that participants’ problem gambling was, the more money they spent on loot boxes.’²⁹ Subsequent psychology research has generally consistently reported some

relationship between problem gambling and loot boxes.³⁰ Further research is required to conclusively identify the exact nature of the relationship between loot boxes and gambling; however, arguably, further independent research is currently being stifled by the video game industry's general failure to be socially responsible by cooperating with academics by providing verifiable player spending data on loot boxes.

2.2. Loot box prizes as rewards in a variable-ratio schedule of reinforcement

Players' problematic escalating desire to purchase and open loot boxes may be explained by applying the behavioural psychology concept of 'reinforcement:' Skinner demonstrated that a certain desired behaviour can be 'reinforced' in a subject through a gradual process of incrementally 'rewarding' behaviours which constitute correct steps towards the formation of that certain desired final behaviour.³¹ Rare and valuable prizes obtained from loot boxes have been likened in popular media to 'rewards' which are able to 'positively reinforce' the player behaviour of purchasing and opening more loot boxes through the release, in the

³⁰ See David Zendle and Paul Cairns, 'Loot Boxes Are Again Linked to Problem Gambling: Results of a Replication Study' (2019) 14 PLoS One 14(3): e0213194 <doi.org/10.1371/journal.pone.0213194> accessed 13 April 2020; Zendle and others (n 1); Gabriel A Brooks and Luke Clark, 'Associations between Loot Box Use, Problematic Gaming and Gambling, and Gambling-Related Cognitions' (2019) 96 Addictive Behaviors 26; Søren Kristiansen and Majbritt Christine Severin, 'Loot Box Engagement and Problem Gambling among Adolescent Gamers: Findings from a National Survey' (2019) 103 Addictive Behaviors 106254; Wen Li, Devin Mills and Lia Nower, 'The Relationship of Loot Box Purchases to Problem Video Gaming and Problem Gambling' (2019) 97 Addictive Behaviors 27; Chanel J Larche and others, 'Rare Loot Box Rewards Trigger Larger Arousal and Reward Responses, and Greater Urge to Open More Loot Boxes' (2019) Advance online publication. player's brain, of dopamine,³² a neurotransmitter activated by rewards, and which causes 'wanting' and potentially 'addiction.'³³

The randomised and unpredictable value of the rewards obtained from loot boxes qualifies their reward schedule as the variable-ratio schedule of reinforcement.³⁴ This particular schedule of reinforcement rewards the subject unpredictably such that they are forced to exhibit the desired behaviour repeatedly, even when they are not guaranteed to obtain a reward for each instance of doing so, in the hope that any one such instance of the desired behaviour would finally elicit a reward.³⁵ This schedule of reinforcement is widely known to and heavily abused by gambling operators.³⁶

The psychology literature appreciates that the positive reinforcement framework, particularly the variable-ratio schedule of reinforcement, is capable of causing the acquisition of extremely persistent behaviours, *e.g.*, gambling and,

perhaps by extension, purchasing and opening loot boxes, and therefore can explain why loot boxes may constitute a predatory monetisation method.³⁷

2.3. Behavioural economics: loot boxes may abuse irrational biases

In addition to loot boxes' link with problem gambling and their potential abuse of the variable-ratio schedule of reinforcement, loot boxes may also be predatory because they present and abuse experimentally demonstrable decision-making cognitive biases and fallacies of the player,³⁸ and thereby cause players to make irrational, 'maladaptive purchasing decisions.'³⁹ It is arguable that, when influenced and misled by decision-making biases, the player's 'choice' to purchase and open loot boxes is no longer free, voluntary and informed. This is synonymous with how gamblers are influenced by fallacies and decision-making heuristics,⁴⁰ which simplify judgement but may lead to 'severe and systematic errors.'⁴¹ For example, ignoring any house rules, the popular game of 38-pocket American roulette has an expected value of -5.26% , thus a bet of \$1 is expected to, in the long-term, on average, lose \$0.0526.⁴² Playing roulette in these circumstances is irrational. Nonetheless, gamblers continue willingly to make the decision of betting on roulette and participating in other gambling games, and losing their money because they are

⁴² Epstein (n 40) 131–135.

influenced by decision-making fallacies which cause them to make irrational decisions.⁴³

2.3.1. Entrapment

Irrational biases, previously identified to arise in relation to gambling, may also be abused by game companies to cause players to purchase more loot boxes than they otherwise would have. One such bias has been identified as ‘entrapment,’ whereby ‘a decision-maker continues to expend resources at least in part to justify previous, hitherto unfulfilled, expenditures.’⁴⁴ For example, ‘when the gambler wishes to recoup losses he has already incurred and therefore decides to roll the dice “just one more time.”’⁴⁵ Similarly, the loot box-purchasing player may wish to justify the losses they have incurred in their previous failed loot box openings (when they did not obtain the rewards they wanted) by buying even more loot boxes in the hope of finally obtaining their desired valuable rewards; therefore, entrapment may deceptively cause the player to make ‘maladaptive’ loot box purchasing decisions.⁴⁶

2.3.2. Gambler’s fallacy

⁴³ See DB Cornish, ‘Gambling, a Review of the Literature and Its Implications for Policy and Research: A Home Office Research Unit Report’ (Home Office Research Study 42, Her Majesty’s Stationery Office 1978) ch 11.

⁴⁶ King and Delfabbro, ‘Predatory Monetization Schemes in Video Games (e.g. “Loot Boxes”) and Internet Gaming Disorder’ (n 27) 1967; Daniel L King and others, ‘Unfair Play? Video Games as Exploitative Monetized Services: An Examination of Game Patents from a Consumer Protection Perspective’ (2019) 101 *Computers in Human Behavior* 131, 140–141.

Another such bias is the ‘gambler’s fallacy.’⁴⁷ For example, ‘[a]fter observing a long run of red on the roulette wheel, most people erroneously believe that black is now due...’⁴⁸ Such gamblers are failing to rationally recognise independent random events as independent,⁴⁹ and are instead irrationally and erroneously interrelating them.⁵⁰ The gambler’s fallacy could apply to the purchasing and opening of loot boxes because players may erroneously interrelate each independent loot box openings and believe that they would gain a better chance of ‘winning’ and opening valuable content after successively ‘losing’ and failing to obtain rare items. Accordingly, the gambler’s fallacy is capable of misleading the player into purchasing more loot boxes immediately after they had just failed to obtain rare items from a prior batch of loot box purchases, which would result in the player spending more money on loot boxes than they had previously intended to or budgeted for. It is particularly concerning that some games manipulate the probabilities of obtaining rarer rewards according to the player’s spending behaviour: ‘pity-timer’ mechanics increase the probabilities of acquiring rarer rewards, or guarantee their acquisition, after the player has failed to obtain the rarer rewards in prior attempts.⁵¹ These pity-timers arguably reinforce the gambler’s fallacy by literally making it true with regards to certain, but not all, loot boxes:

players may erroneously assume that all loot boxes have an in-built pity-timer mechanic.

2.3.3. Near-miss effect

The third irrational bias that loot boxes may abuse is the ‘near-miss effect.’⁵² A ‘near-miss’ occurs when ‘an unsuccessful outcome is proximal to the designated win, such as when a chosen horse finishes in second place or when two cherries are displayed on the slot machine payline.’⁵³ The near-miss effect refers to how the presentation of a losing situation as a near-miss encourages players to make further attempts.⁵⁴ Clark *et al.* argued that ‘the recruitment of win-related regions [of the brain] during near-miss outcomes underlies their ability to promote gambling behavior.’⁵⁵ Loot box openings are often presented with explosive visual animation and celebratory audio effects regardless of the value of the rewards obtained. Arguably, loot boxes are designed to build anticipation in the player similar to gambling,⁵⁶ and to disappoint that player in order to expose them to a near-miss so as to encourage further purchases.

2.3.4. Blurring of lines between gambling and video gaming

⁵² Autorité de regulation des jeux en ligne [Regulatory Authority for Online Games; ARJEL] (France), ‘Rapport d’activité 2017-2018 [Activity Report 2017-2018]’ (2018) 5 <www.arjel.fr/IMG/pdf/rapport-activite-2017.pdf> accessed 3 August 2020; Cecilia D’Anastasio, ‘Why Opening Loot Boxes Feels Like Christmas, According To Game Devs’ (*Kotaku*, 20 March 2017) <kotaku.com/why-opening-loot-boxes-feels-like-christmas-according-1793446800> accessed 24 August 2019; Moshirnia (n 12) 87; David Zendle, Rachel Meyer and Harriet Over, ‘Adolescents and Loot Boxes: Links With Problem Gambling and Motivations for Purchase’ (2019) 6 Royal Society Open Science: 190049 4 <doi.org/10.1098/rsos.190049> accessed 13 April 2020; Zendle and others (n 1) 183.

⁵⁵ Clark and others (n 53) 485.

⁵⁶ See Larche and others (n 30); Brady and Prentice (n 30).

Reid suggested that people inexperienced with gambling may be more prone to the near-miss effect.⁵⁷ This is particularly worrying and relevant to the potential regulation of loot boxes because many players engaging with loot boxes do not necessarily realise that they are gambling when they play video games. Indeed, sixteen regional gambling regulators⁵⁸ have expressed their concerns with the risks posed by ‘the blurring of lines between gambling and ... video gaming.’⁵⁹ Loot boxes are randomised, not ‘innocent’ and may represent ‘games of chance,’ but they are presented (or, if viewed more sceptically, hidden) within video games which are generally perceived as ‘games of skill.’⁶⁰ The conflation of the two activities is socially worrying and a ‘clear public concern’ because consumers may be unable to differentiate between the video game itself and (quasi-)gambling elements incorporated into it (e.g., loot boxes), such that, for example, children may end up gambling unknowingly with ‘money intended for computer game products’ given to them to spend by their similarly unknowing parents.⁶¹

2.4. Call for game companies to release loot box spending data

⁵⁷ Reid (n 54) 36.

⁵⁸ Fifteen of the regulators are from Europe and represent: Austria, Czechia (the Czech Republic), France, Gibraltar, Ireland, the Isle of Man, Jersey, Latvia, Malta, The Netherlands, Norway, Poland, Portugal, Spain, the United Kingdom; and one, the Washington State Gambling Commission, is from the United States of America.

Actual loot box purchasing data collected and possessed by game companies⁶² is required to conduct comprehensive, empirical investigations on the relationship between loot boxes and gambling; to confirm if the additional introduction of any irrational biases outlined above induces maladaptive loot box purchases; and to assess the potential harms of loot boxes in general. However, currently, such crucial data has not been made available for independent research by game companies. Although this failure to release data can be appreciated from a commercial standpoint, this position does not treat consumers fairly, and is socially irresponsible and arguably unethical. Although such data may be commercially sensitive as they may reveal the amount of total sales and user numbers,⁶³ game companies should proactively collaborate with researchers to find appropriate ways to desensitise and anonymise the data released.⁶⁴ For example, the limited release of the anonymised spending data of 1000 random users would not reveal any business sensitive information but would still assist empirical research significantly. The release of such data may also give rise to data protection concerns; however, an update to the privacy policy should resolve any such issue. Most players would likely welcome such research.

The applicability and effectiveness of industry data to research was demonstrated by Zendle who took advantage of the removal of paid loot boxes from

⁶² As compared to experimental loot box purchasing data that may be collected by researchers using a specially designed which would not have been derived from a commercially viable video game, or potentially biased and inaccurate anecdotal data reported by players themselves.

⁶³ The Author is grateful to an anonymous peer-reviewer for identifying this issue.

⁶⁴ Whilst also ensuring that no conflicts of interests arise, *e.g.*, when a certain company's game is incidentally 'promoted' by empirical research for being less harmful, especially when other companies were not given the opportunity to be assessed in a comparable manner.

Heroes of the Storm in March 2019⁶⁵ and conducted a survey which demonstrated that ‘When loot boxes were removed from *Heroes of the Storm*, problem gamblers spent significantly less money in-game.’⁶⁶ However, Zendle’s conclusion was only tentative due to a lack of verifiable datasets: Zendle was only able to rely on unverifiable, self-reported data from players. Only with the release of industry data by game companies for further independent empirical research could the many questions surrounding the potential harms of loot boxes be fully assessed and answered.⁶⁷

Currently, there is an ‘information asymmetry’ between elements of the video game industry that implement paid loot boxes and the public: these companies are in possession of data (if not also the results) as to the potential harms of loot boxes, but the public and regulators are forced by these companies to have access to little, if any, information. This information asymmetry renders the current relationship between these companies and the public arguably inequitable, and renders the current relationship between these companies and regulators ‘evasive’ and disingenuous.⁶⁸

2.4.1. Different perspectives on the ‘ethics’ of loot boxes in the industry

⁶⁵ No reasoning was provided for this removal, see Blizzard Entertainment, ‘Heroes of the Storm PTR Patch Notes – March 18, 2019’ (*Heroes of the Storm Official Website*, 18 March 2019) <heroesofthestorm.com/en-us/blog/22933130/heroes-of-the-storm-ptr-patch-notes-march-18-2019-2019-3-18> accessed 11 August 2019.

⁶⁶ Zendle (n 20) 11.

⁶⁷ *ibid.*

⁶⁸ See Clive Efford, Matthew Weissinger and Canon Pence, ‘Oral Evidence (Questions 1156–1157) to the Immersive and Addictive Technologies Inquiry of the Digital, Culture, Media and Sport Committee of the House of Commons’ (2019) <data.parliament.uk/writtenevidence/committeeevidence.svc/evidencedocument/digital-culture-media-and-sport-committee/immersive-and-addictive-technologies/oral/103191.pdf> accessed 3 August 2020.

It ought to be recognised that different video game companies hold divergent perspectives on the continued implementation of loot boxes. When giving evidence to the Digital, Culture, Media and Sport Committee of the UK House of Commons (DCMS Committee), Kerry Hopkins, Vice President for Legal at Electronics Arts, refused to recognise paid loot boxes implemented in *FIFA Ultimate Team* as paid ‘loot boxes’ and categorised them as ‘quite ethical and quite fun.’⁶⁹ In contrast, Epic Games has implemented ‘X-Ray Llamas’ which are paid loot boxes that reveal all of its rewards prior to purchase, thus allowing players to make an informed decision.⁷⁰ This effectively removed randomisation from the purchasing of loot boxes, but not from the mechanic itself,⁷¹ and rendered the product no longer a ‘loot box’ *per se* and more akin to purchasable additional game content, *i.e.*, ‘DLCs.’ Other game companies never implemented loot boxes in their games and have no plans to do so in the future: Wan Hazmer of Metronomik, an indie developer, has recognised the ethical issues relating to the implementation of paid loot boxes and refused to implement them despite potential commercial loss.⁷² Given the current notoriety of and aversion to paid loot boxes amongst video game players, it is arguable whether or not the decision not to implement loot boxes by a particular game company could be seen as an ‘ethical’ decision that is capable of being appreciated by players and

⁷⁰ Fortnite Team, ‘Loot Unboxing’ (*Fortnite Official Website*, 25 January 2019) <www.epicgames.com/fortnite/en-US/news/loot-unboxing> accessed 3 August 2020. See also Rebekah Valentine, ‘Epic Games Commits to Loot Box Transparency across Portfolio’ (*GamesIndustry.biz*, 9 August 2019) <www.gamesindustry.biz/articles/2019-08-09-epic-games-commits-to-loot-box-transparency-across-portfolio> accessed 9 August 2019.

⁷¹ Which arguably ensures that they are still ‘quite fun’ as the content that the player can choose to purchase (or not) is still randomised.

⁷² Ellia Pikri, ‘A Glimpse Into Wan Hazmer’s New RM300K M’sian Project After The Success Of FFXV’ (*Vulcan Post*, 22 May 2018) <vulcanpost.com/640032/wan-hazmer-metronomik-malaysia-game> accessed 23 December 2019.

may be promoted by the media,⁷³ and would in turn drive up sales of the game and be a better commercial decision in the long-term than implementing paid loot boxes.

Although the industry does not hold a uniform position on whether or not paid loot boxes are ethical,⁷⁴ the industry's failure to release data for independent research has been universal. For companies that are continuing to implement paid loot boxes in video games, their failure to cooperate with regulators and researchers by providing loot box spending data is irresponsible and arguably unethical, but may be excused for commercial reasons, given that the area remains unregulated in most countries. However, companies that have already stopped implementing paid loot boxes (perhaps in recognition of the ethical implications), but are still in possession of past loot box spending data, would not necessarily be negatively affected by the prospective regulation of loot boxes and may be in a position to release these data for independent research. In fact, the release of this data may benefit responsible companies immediately through positive publicity, and also long-term if prospective regulation of loot boxes would divert spending on loot boxes to other more ethical video gaming monetisation methods. However, no such release has been forthcoming. Socially responsible game companies that are in a position to gain (or at least in a position not to lose) from the release of loot box spending data should publish it and support independent research.⁷⁵

⁷³ See text to n 160.

⁷⁴ And whether or not particular implementations of paid loot boxes are ethical, as pointed out by an anonymous peer-reviewer, *e.g.*, in relation to 'pay-to-win,' whereby a player can only be competitive when compared to other players if they continually invest money into the game by purchasing newly released products.

⁷⁵ For academics, policymakers and NGO representatives calling for the release of industry data, see, *inter alia*, Zendle (n 20) 10; Margaret Wood Hassan to Patricia Vance (14 February 2018) 2 <hassan.senate.gov/imo/media/doc/180214.ESRB.Letter.Final.pdf> accessed 18 August 2019; Federal Trade Commission (US), 'Inside the Game: Unlocking the Consumer Issues Surrounding Loot Boxes, Session 2' (Public Workshop, Washington, DC, US, 7 August 2019) <www.ftc.gov/news-events/audio-video/video/inside-game-unlocking-consumer-issues-surrounding-loot-boxes-session-2> accessed 11 August 2019 video record timestamps 1:52:54–1:53:08.

2.5. Pre-emptive regulation justified by the precautionary principle?

The DCMS Committee, in its recent inquiry report, argued that the ‘precautionary principle’ (that ‘the lack of scientific certainty cannot justify [regulatory] inactivity in cases of high risk’⁷⁶) should apply to justify the pre-emptive regulation of loot boxes, because game companies cannot prove that the monetisation schemes which they have designed and implemented, such as loot boxes, are *not* harmful.⁷⁷ The Committee went above and beyond only calling for game companies to release industry data for research into the extent of the potential harm of loot boxes in order to better inform potential regulation: the Committee argued that it is no longer necessary for academics or regulators to prove that loot boxes represent a predatory monetisation method and are harmful in order to justify regulation, and that it is now instead the responsibility of the game companies implementing these monetisation methods to prove that loot boxes are *not* predatory and harmful in order to justify the continued lack of regulation. The DCMS Committee’s assertion is worrying in that negative proof of loot boxes not being harmful is impossible to obtain from a scientific perspective: it is literally asking the impossible from the industry.⁷⁸ A more reasonable approach would be to ask for evidence that harm is unlikely or minimal.

2.5.1. Avoiding undesirable but potentially imminent overregulation

⁷⁶ Miguel Á Recuerda Girela, ‘Risk and Reason in the European Union Law’ (2006) 1 European Food and Feed Law Review 270, 285.

⁷⁷ DCMS Committee (n 26) para 79.

⁷⁸ Xiao, ‘Which Implementations of Loot Boxes Constitute Gambling?’ (n 1).

The DCMS Committee recommended that UK gambling law should be amended in due course after consultation to regulate paid loot boxes,⁷⁹ whilst, only a few months later, the Gambling Industry Committee of the UK House of Lords recommended the *immediate* regulation of paid loot boxes as gambling by executive regulations without waiting for further consultation.⁸⁰ These recommendations teeter on the edge of overregulation and mirror the position taken by the Belgian gambling regulator (that *all* paid loot boxes constitute gambling regardless of whether or not their rewards are worth real-world money, and that consumers' access to all loot boxes would be prohibited, unless they are appropriately licensed as regulated gambling), which has led to the complete removal of certain games from the Belgian market, *e.g.*, *Animal Crossing: Pocket Camp* (2017, Nintendo & NDcube),⁸¹ and therefore deprived consumers of the opportunity to play certain games. An overly paternalistic outright ban of loot boxes also unduly restricts the industry's creative output and economic potential⁸² (although forcing game companies to stop defaulting to monetising with loot boxes and instead invent and experiment with other more ethical monetisation methods may revitalise creativity). Both game companies and players lose out when loot boxes are overregulated. These comparatively drastic regulatory positions that have been recommended (a version of which has been adopted in Belgium) suggest that, if the video game industry continues to be uncooperative when working with independent researchers and

⁸² Xiao and Henderson (n 51) 10. See also Moshirnia (n 12) 111–112.

regulators, overregulation negatively affecting the industry creatively and commercially may be the inevitable result. The industry should be well-advised to act responsibly now to avoid this potential undesirable outcome.

2.5.2. Certain implementations of loot boxes are defensible

The most prominent problem with paid loot boxes is potential overspending.⁸³ A loot box implementation released monthly whose rewards are all guaranteed to be obtained if the maximum capped spending of £30 is reached by the player is defensible. A paid loot box mechanic that can simultaneously be relatively easily accessed by performing non-paid in-game actions, such as logging-in to the game or defeating enemies, would also make the implementation more defensible. If the rewards of the loot box do not influence the player's in-game powers (and perhaps only make cosmetic changes), and would not advantage the player when compared to other players or a hypothetical version of themselves who did not purchase loot boxes, then this implementation is also defensible. These changes in loot box implementation which try to prevent overspending and avoid placing undue pressures on the consumer to spend money (such as when a loot box is made available for purchase only for a limited time) can be referred to as 'ethical game design.'⁸⁴ Therefore, in the Author's opinion, the consumer protection issue relating to loot boxes needs not necessarily be solved by the outright ban of loot boxes, which may negatively affect game companies financially and deny players access to certain

⁸³ Notwithstanding the potential harms of non-paid loot boxes and other seemingly harmless gambling references 'normalising' gambling behaviours by making them appear to be regular social activities that 'normal' people engage with, as such potential harms remain to be empirically established, see Xiao, 'Which Implementations of Loot Boxes Constitute Gambling?' (n 1).

⁸⁴ For other ethical game design measures that game companies should consider implementing, see Daniel L King and Paul H Delfabbro, 'Video Game Monetization (e.g., "Loot Boxes"): A Blueprint for Practical Social Responsibility Measures' (2019) 17 International Journal of Mental Health and Addiction 166. See also Xiao and Henderson (n 51).

video game content, and which may not be the best solution to the problem for all parties involved. Accordingly, the prohibitive gambling law approach to regulating loot boxes should be critiqued.

3. Regulating loot boxes as gambling? Limited success and many flaws

The obvious regulatory response to loot boxes has been to examine whether or not they constitute ‘gambling’ under existing gambling regulation, and to classify and regulate them as such if they do. The benefit of directly adopting existing gambling law to potentially regulate loot boxes is that such laws are already legislated and in effect, and therefore can be immediately executively applied by relevant regulators, if appropriate.

3.1. Divergent definitions of gambling

To oversimplify the divergent gambling laws of various jurisdictions, ‘gambling’ is generally conceived of in law as requiring three elements: ‘stake,’ ‘chance,’ and ‘prize.’⁸⁵ Certain implementations of loot boxes may plainly constitute gambling under existing laws by satisfying these elements. However, each jurisdiction defines each element differently, and may add or remove elements: for example, under UK law, the ‘prize’ must be worth real-world money for the element to be satisfied;⁸⁶ in contrast, in Belgium, there is no ‘prize’ element *per se*, and Belgian

⁸⁵ See Daniel L. King, ‘Online Gaming and Gambling in Children and Adolescents – Normalising Gambling in Cyber Places: A Review of the Literature’ (Victorian Responsible Gambling Foundation 2018) 21–22 <web.archive.org/web/20200629185932/https://responsiblegambling.vic.gov.au/documents/479/Online-gaming-and-gambling-in-children-and-adolescents_.pdf>.

⁸⁶ See UK Gambling Commission, ‘Virtual Currencies, ESports and Social Gaming — Position Paper’ (2017) 7, para 3.17 <www.gamblingcommission.gov.uk/PDF/Virtual-currencies-eSports-and-social-casino-gaming.pdf> accessed 14 April 2020.

gambling law instead examines whether or not there is a ‘chance of wins or losses.’⁸⁷

A prize which is not worth real-world money is nonetheless a ‘win’ under Belgian gambling law.⁸⁸

Different gambling laws mean that certain implementations of loot boxes may constitute gambling in one jurisdiction, but not in another.⁸⁹ For example, the UK Gambling Commission opined that only loot boxes which are both paid for and which provide rewards worth real-world money constitute ‘gambling,’⁹⁰ and that neither non-paid loot boxes (which may nonetheless provide rewards worth real-world money), nor paid loot boxes that do not provide rewards worth real-world money constitute ‘gambling.’⁹¹ The Dutch⁹² and French⁹³ gambling regulators came to similar conclusions. In contrast, the Belgian gambling regulator opined that paid loot boxes constitute gambling regardless of whether or not their rewards can be transferred between players and therefore possess real-world value.⁹⁴

3.2. Divergent degrees of enforcement

⁸⁷ Belgische Kansspelcommissie [Belgian Gaming Commission], ‘Onderzoeksrapport loot boxen [Research Report on Loot Boxes]’ (2018) 11 <www.gamingcommission.be/opencms/export/sites/default/jhksweb_nl/documents/onderzoeksrappoort-loot-boxen-final-publicatie.pdf> accessed 14 April 2020.

⁹³ ARJEL (n 52) 5, 7.

⁹⁴ Belgische Kansspelcommissie [Belgian Gaming Commission] (n 87) 17.

A divergence can be identified even between the Dutch, and the UK and French regulators: although they have taken similar regulatory positions on which implementations of loot boxes constitute gambling, they enforce their positions to different degrees. The Dutch regulator was much less sympathetic towards game companies, who ostensibly explicitly disallow the transfer and selling of in-game items between players (which would give them real-world value) but nonetheless implicitly facilitate such activities. The Dutch regulator opined that such implementations constitute gambling. The UK and French regulators gave game companies the benefit of the doubt and determined that such transfer facilities do not necessarily render a loot box ‘gambling’ if and when the game companies have attempted to restrict the players’ ability to transfer and sell in-game items: the UK regulator opined that the restriction has to be ‘successful,’⁹⁵ but no prosecution or other enforcement action has been brought against evidently ‘unsuccessful’ implementations that can be and have been exploited;⁹⁶ the French regulator decided that, at present, the potential monetisation of the prizes through third-party websites has not been explicitly authorised by the game operator, and, therefore, the prizes of such loot boxes do not possess monetary value.⁹⁷

3.3. Lack of universal, international consumer protection

The potential harms of paid loot boxes do not appear to be related to whether or not their prizes are worth real-world money; paid loot boxes whose rewards are not transferable and are not worth real-world money appear to be just as potentially harmful.⁹⁸ When a certain implementation of loot boxes constitutes gambling in a

⁹⁵ See UK Gambling Commission, *Position Paper* (n 86) para 3.18.

⁹⁶ See Drummond and others (n 1).

⁹⁷ ARJEL (n 52) 7.

⁹⁸ Zendle and others (n 1) 188, 190.

certain jurisdiction, then it should be regulated as gambling in that jurisdiction. Unfortunately, not all implementations of paid loot boxes fall under the definitions of gambling in all jurisdictions. This meant that consumers are protected only if they happen to live in a country whose existing gambling law covers both paid loot box types. Indeed, currently, only Belgian consumers are fully protected, as all paid loot boxes have been removed; in the Netherlands, game companies complied by only removing paid loot box reward transfer features (thus ensuring that loot box rewards are not worth real-world money), without removing paid loot boxes themselves.⁹⁹ Dutch consumers remain exposed to the potential harms of paid loot boxes whose rewards are not worth real-world money. The contrast in compliance by 2K Games in the Netherlands and Belgium is particularly telling.¹⁰⁰ Consumer protection is not ensured universally as it should be.

3.4. Departing from the ‘regulate loot boxes as gambling’ approach

All paid loot boxes should be regulated regardless of whether or not their rewards are worth real-world money, but not necessarily as gambling *per se*. Multiple papers in the legal literature and gambling regulators have attempted to fit the regulation of loot boxes into the existing gambling law framework of various jurisdictions¹⁰¹ (e.g., arguing that certain implementations *should* constitute illegal lottery gambling under Californian law¹⁰²). Such assessments often fail in relation to

¹⁰² Hong (n 101) 65–68.

paid loot boxes whose rewards are not worth real-world money because the ‘prize’ element cannot be satisfied. However, in the Author’s opinion, the inability of existing gambling law in many jurisdictions to include paid loot boxes whose rewards are not worth real-world money should be accepted. Hasty amendments to gambling law that extends existing definitions of gambling to cover such implementations of loot boxes, as for example recommended by the DCMS Committee in the UK,¹⁰³ is not necessarily well-advised: expanding the legal concept of what may constitute ‘prizes,’ specifically the meaning of ‘money’s worth’ in the UK to include perceived non-monetary value, ostensibly only for the purpose of regulating loot boxes, may potentially unfairly render other harmless activities, and other activities which are unlikely to be harmful, ‘gambling’ in the eyes of the law and unduly restrict people’s ability to engage with them. Additionally, regulating loot boxes as gambling would face the same difficulties encountered by the regulation of online gambling in general, including complications with enforcement when consumers gamble with overseas service providers.¹⁰⁴

4. Consumer protection measures?

The regulation of loot boxes should also be approached from a consumer protection perspective, in addition to applying existing gambling law.¹⁰⁵ Ethical game design measures that seek to minimise harms include, amongst others: disclosing the probabilities of obtaining potential rewards; establishing maximum

¹⁰³ DCMS Committee (n 26) paras 97–98.

spending limits; and disabling ‘cash out’ features.¹⁰⁶ These three measures have been partially implemented in certain countries and as self-regulation by the industry in other jurisdictions. The practicality of regulating through and enforcing these measures are critiqued, and recommendations as to how to improve their implementation in the future are made.

4.1. Disclosure of probabilities of obtaining potential rewards

The People’s Republic of China (PRC) did not approach the regulation of loot boxes from a gambling perspective: instead, video gaming service providers in the PRC are required to disclose the probabilities of obtaining potential rewards.¹⁰⁷ The video game industry has also generally been accepting of this measure as a self-regulation solution in other jurisdictions.¹⁰⁸ For example, the Entertainment Software Association (ESA) announced that the video game industry is ‘committing’ to ‘further inform[ing] consumer purchases:’ the three leading hardware providers, Sony; Microsoft and Nintendo, ‘will require paid loot boxes in games developed for their platforms to disclose information on the relative rarity or probability of obtaining randomized virtual items.’¹⁰⁹ The ESA’s proposal would have a global

¹⁰⁹ Entertainment Software Association (ESA), ‘Video Game Industry Commitments to Further Inform Consumer Purchases’ (ESA Official Website, 7 August 2019) <www.theesa.com/perspectives/video-game-industry-commitments-to-further-inform-consumer-purchases> accessed 8 August 2019.

reach and will likely better protect many consumers across the world. The ESA also identified that several major game publishers already disclose such information in their games.¹¹⁰ Apple and Google both also require probability disclosures for games published on their respective app stores which contain paid loot boxes.¹¹¹

4.1.1. Discretion as to the method of compliance is problematic

Probabilities disclosures do not restrict consumer choice, but only seek to better inform it. Similar disclosure requirements are imposed in regards to gambling in other jurisdictions ‘to enable the customer to make an informed decision about his or her chances of winning.’¹¹² However, when discretion is given to gambling operators as to the amount; format and location of how such information is to be presented to consumers, gambling operators have arguably chosen suboptimal methods in order to misguide consumers.¹¹³ In the PRC, significant discretion is allowed to game companies as to where the probabilities should be disclosed: disclosures made either in-game on the loot box purchase page or the game’s official website are both compliant with the law.¹¹⁴ However, arguably, a disclosure made in-game on the loot box’s purchase page would appear more prominently to the consumer than a disclosure made on an official website, whose existence the player

¹¹⁴ cf the more detailed guidance, which includes screenshots and examples, as to how to comply with probabilities disclosure obligations provided by the South Korean self-regulation, see K-GAMES (n 108) 19–32.

may not even be aware of. A disclosure made in-game would accordingly arguably be more likely to be read, and therefore be more effective at informing consumers and preventing overspending.

The PRC law also did not set out requirements as to how accessible the disclosures ought to be. For example, the disclosure in certain games can only be accessed if the player interacts with a tiny question mark hidden away in a corner of the loot box purchase screen; for other games, the disclosure can only be accessed after the player follows multiple hyperlinks on the official website. The disclosure could readily be provided more prominently and be more easily accessible, but many game companies have chosen not to provide this information in the most effective way. Indeed, the probabilities disclosure could be an automatic pop-up (with audio effects, such as an alarm sound) that interrupts purchase when the player attempts to buy loot boxes. Such an intrusive disclosure may be more effective at alerting the consumers as to the probabilities of obtaining rewards and preventing overspending.

Apple, Google and the ESA have similarly not specified where the probabilities should be disclosed and how accessible the disclosure should be. The PRC law, and existing and prospective self-regulation, can be improved: specific requirements as to how, when and where probabilities disclosures should be made may ensure that disclosures are easy to access and understand, and are made at similar locations in all games, thus ensuring players playing multiple games and players playing a new game would readily be able to find the disclosures, and therefore be more effective at informing consumer choice and preventing overspending. Compliance rate with the PRC legal obligation (and Apple and

Google's existing self-regulation) to disclosure probabilities in general, and the discretionary methods of compliance that game companies have chosen to adopt have not been assessed empirically. Future research should examine these aspects to better inform future legal regulation and/or self-regulation.

4.1.2. Enforcement is necessary to ensure consumer confidence

A flaw with probabilities disclosures is that players cannot verify and thus be confident that the probabilities disclosed by the game companies are accurate. This is especially true in relation to voluntary disclosures and disclosures which are not scrutinised through some form of enforcement. Indeed, the PRC law did not specify how it will be enforced and it is unclear how the law is currently being enforced, if at all.¹¹⁵ Apple and Google's existing self-regulation similarly appears to be based on trust and the probabilities disclosed by game companies are not scrutinised by either platform provider.

In contrast, the South Korean self-regulation system, organised by K-GAMES (Korea Association of Game Industry), which provides a certification system that 'incentivises' disclosure, has an enforcement system as set out in the *Enforcement Rules of Self-regulation Code for Healthy Game Culture*.¹¹⁶ Article 11 explains that the compliance of the most popular games on each platform will be monitored every month.¹¹⁷ Article 12 details that: for the first instance of identified non-compliance, the game company will be advised as to how it can comply; for the second offence,

¹¹⁵ The Author reasons from anecdotal evidence that limited enforcement is carried out when competing game companies scrutinise and report each other, and when consumers report games that they are playing, to the PRC's official consumer protection hotline.

¹¹⁶ See K-GAMES (n 108) 40–43.

¹¹⁷ *ibid* 42.

the company will be warned that it is non-compliant; and for the third offence, the company's violation will be identified and published to inform consumers and it will also be decertified.¹¹⁸ K-GAMES' monthly 'name-and-shame' admirably does not collude with influential game companies and does not discriminate against smaller game companies by only targeting them: *Dota 2* (2013), one of the most popular MOBA games developed and published by Valve, a leading international video game company that developed and operates Steam, is prominently published at the top of the name and shame list for repeated non-compliance.¹¹⁹

4.1.3. Voluntary self-regulation has no teeth and may be ignored

K-GAMES' self-regulatory system is exemplary: the PRC law; Apple and Google's existing self-regulation; and the ESA's prospective self-regulation should emulate K-GAMES' enforcement system by ensuring that the probabilities disclosures made by companies are accurate and can be trusted by consumers. However, it must be noted that even with a robust self-regulatory system, such as K-GAMES', some games remain non-compliant but continue to be popular with consumers. For example, Valve's *Dota 2* has been declared non-compliant 19 times as of June 2020 by K-GAMES without inspiring any change to *Dota 2*'s non-compliance and Valve's non-cooperation,¹²⁰ which means that consumers remain at risk of potential harm. Indeed, self-regulation may not ultimately be effective as measures

¹²⁰ *ibid.*

remain voluntary. Decertification, and name-and-shame may not be sufficiently strong disincentives. Legal sanctions, such as fines and injunctions against the continued non-compliant operation of such games, may be the only reliable solution in such cases to guarantee compliance and consumer protection. A combination of the binding force of law and a robust enforcement regime may be a satisfactory first step to ameliorating the potential harms of loot boxes by responsibly informing consumers of the (un)likelihood of obtaining rewards and the potential harms of paid loot boxes.

4.2. Maximum spending limit

As argued in Section 2.5.2. above,¹²¹ the most concerning issue with loot boxes is overspending. More ethically designed implementations are defensible and need not necessarily be prohibited. The probabilities disclosure measure discussed above may assist players in making more informed decisions and therefore becoming less likely to overspend. However, it is possible to be more interventionist by literally preventing overspending by setting a maximum limit on the amount of money players are allowed to spend on loot boxes.

In gambling contexts, ‘pre-commitment limit-setting involves users specifying (voluntarily or compulsorily), before engaging in gambling, the maximum they would like to spend. Once reached, this limit triggers a reminder message and a cooling-off period in which the player is unable to gamble further.’¹²² Pre-commitment limit-setting is known to have a positive, if subtle, effect on reducing

¹²¹ See text to nn 83–84.

¹²² Aaron Drummond, James D Sauer and Lauren C Hall, ‘Loot Box Limit-Setting: A Potential Policy to Protect Video Game Users With Gambling Problems?’ (2019) 114 *Addiction* 935, 935; cf King and Delfabbro, ‘Loot Box Limit-Setting Is Not Sufficient on Its Own to Prevent Players from Overspending’ (n 38).

and controlling problem gambling.¹²³ Although it may not necessarily be the monetary limit itself that curtails the gambling behaviour, but rather the ‘break in play,’ *i.e.*, that the gambler is forced to stop playing, cool off, step back and think rationally, which is effective.¹²⁴

The most prominent issue with setting a maximum spending limit is deciding how much this limit should be, as regulators would need to make the difficult assessment as to what is a fair and equitable amount of money to be spent on a game for a specific period of time.¹²⁵ Drummond, Sauer and Hall recommended a monthly cap of US\$50 (≈£38.21) on loot boxes to ensure the protection of players who would be classified as problem gamblers (*i.e.*, those who would significantly overspend on loot boxes).¹²⁶ US\$50 is not necessarily the most optimal amount of money to spend on loot boxes for every individual consumer: indeed, US\$50 may be quite a lot more money than many players, especially children, would be willing or allowed to spend on a game per month, but US\$50 may also be much less than what an affluent player may want to spend monthly to financially support their favourite game developer. A monthly limit of US\$50 may also be appropriate because it is close to how much a player would be expected to pay when purchasing a video game outright ‘as a

¹²⁴ *ibid* 213.

¹²⁵ cf the PRC judiciary recently expressed perfect willingness to engage with this assessment in relation to how much money a particular child should be allowed to spend on video games given their family’s economic circumstance and the game’s ‘genre:’ their jurisprudence on this point may be insightful once generated, see Leon Y Xiao, ‘People’s Republic of China Legal Update: Supreme People’s Court’s Guiding Opinion on Refund Requests Relating to Unauthorised Online Video Gaming Transactions Paid for by Minors (Published 15 May 2020)’ (2020) *Advance online publication. Gaming Law Review* <doi.org/10.1089/glr2.2020.0014> accessed 3 August 2020.

¹²⁶ Drummond, Sauer and Hall (n 122) 935.

product'¹²⁷ (it is quite reasonable for such a game to be purchased, and for such an amount of money to be spent on video gaming, every month); and because monetising with loot boxes, in a non-predatory manner, and selling game titles outright are equally valid monetisation methods that game companies may adopt and therefore should be treated equally by the law. A relevant point to consider is that the law may be able to disincentivise the implementation of loot boxes by decreasing the maximum monthly spending limit on loot boxes to be lower than the average price of a game software to discourage game companies from monetising with loot boxes, as they would be forced to only be able to generate less revenue if they choose to monetise with loot boxes than otherwise.

4.2.1. Maximum in-game spending limits in South Korea and the PRC

Monthly maximum spending limits on online video games generally (and not limits on loot box spending specifically) have been imposed in South Korea and the PRC against players. The South Korean monthly limits were previously imposed on 'juveniles' under the age of 19 at 70,000 Won (≈£44.8) and on adults at 500,000 Won (≈£320.02). The adult limit was set arbitrarily high and would only have been capable of preventing particularly extreme overspending. Notably, both South Korean limits 'have since been repealed citing unfair economic discrimination against the video game industry as compared to other creative industries.'¹²⁸ The

¹²⁷ The average unit price of a video game software in the UK in 2017 was £33.47, see Katrin Kienast, 'Video Game Software: Unit Price in the UK 2008-2017' (*Statista*, 25 June 2018) <www.statista.com/statistics/282012/video-game-software-unit-price-in-the-united-kingdom-uk> accessed 11 September 2019.

¹²⁸ Leon Y Xiao, 'People's Republic of China Legal Update: The Notice on the Prevention of Online Gaming Addiction in Juveniles (Published October 25, 2019, Effective November 1, 2019)' (2020) 24 *Gaming Law Review* 51, 53; See 문화체육관광부 [Ministry of Culture, Sports and Tourism (S Korea)], '보도자료 - 피시(PC)·온라인게임 성인 결제한도 폐지 [Press Release - Repeal of Maximum Spending Limit for PC and Online Games Imposed on Adults]' (in Korean, 2019) <www.mcst.go.kr/kor/s_notice/press/pressView.jsp?pSeq=17352> accessed 2 September 2019.

PRC had imposed an impractical and unreasonable monthly limit of ¥10 Renminbi (≈£1.10) on minors under the age of 18 in March 2011.¹²⁹ This limit has been updated in November 2019: minors under the age of 8 are prohibited from spending any money at all; minors aged between 8 and 16 are allowed to spend up to ¥200 (≈£22); and minors aged between 16 and 18 are allowed to spend ¥400 Renminbi (£44).¹³⁰ These updated limits are more realistic; however, their regulatory effects remain to be seen.

4.2.2. Enforcement of the limits is difficult

Pre-commitment maximum spending limits have proven difficult to impose compulsorily in gambling contexts: gamblers may be able to switch to another service provider to evade the limit and gamble more (although this issue may be avoided if providers share information between each other).¹³¹ Such enforcement difficulties are similarly present in the video gaming context. Both South Korea and the PRC are countries that have universal national identification card systems that advantageously allow for the verification of the real-life identity of all online players (*i.e.*, all user accounts must belong to a verified real-life identity), which then allows for the enforcement of maximum spending limits against those players across multiple user accounts; across different games and video gaming service providers; and across hardware platforms. However, identity verification regulations have

¹²⁹ 文化部 [Ministry of Culture] (PRC) and others, ‘关于印发《“网络游戏未成年人家长监护工程”实施方案》的通知 [Notice on the Publication of the “Parental Monitoring of the Online Gaming of Minors Project Implementation Plan”] 文市发[2011]6 号’ (*in Chinese*, 15 January 2011) appendix 2, art 2 <old.moe.gov.cn/publicfiles/business/htmlfiles/moe/moe_1779/201105/119727.html> accessed 25 July 2019.

¹³¹ Harris and Griffiths (n 123) 214.

been documented to have been easily bypassed by minors in both South Korea and in the PRC through using the personal identification documents of others, such as the minor's parents' or the internet café operators'.¹³²

In countries without universal identification systems, *e.g.*, the UK,¹³³ these limits are even more difficult to impose against individuals.¹³⁴ The alternative imposition of these limits against only the player's user account, rather than the player's real-life identity, can be circumvented through the creation and use of multiple accounts for the same game, and by simply switching to playing another game. However, unlike in gambling contexts where the gambling game's game design cannot realistically be changed, the multiple account issue can be resolved through ethical game design by heavily disincentivising the player for possessing multiple accounts, *e.g.*, progression through the game requires virtual items that cannot be directly bought using real-world money or transferred between accounts, and must be earned through gameplay. Admittedly, this requires the unlikely voluntary commitment to this measure from the entire video game industry (because such game design would be commercially detrimental), as otherwise the player would simply choose to switch to games with more unscrupulous operators.

4.2.3. Maximum gameplay time limits and curfew shutdown laws

Video gaming has also been regulated and restricted using the concept of time, rather than money. Such measures may not be directly applicable to loot box

¹³² Jiyun Choi and others, 'Effect of the Online Game Shutdown Policy on Internet Use, Internet Addiction, and Sleeping Hours in Korean Adolescents' (2018) 62 *Journal of Adolescent Health* 548, 549, 551–552; Jing Da Zhan and Hock Chuan Chan, 'Government Regulation of Online Game Addiction' (2012) 30 *Communications of the Association for Information Systems* 193 <aisel.aisnet.org/cais/vol30/iss1/13>.

¹³³ See Identity Documents Act 2010 s 1 repealing Identity Cards Act 2006.

¹³⁴ Xiao, 'People's Republic of China Legal Update' (n 128) 52, fn 2.

spending, but may provide certain insight from a regulatory perspective. Maximum gameplay time limits seek to limit the total amount of time that a player is allowed to play games. Curfew shutdown laws restrict players from playing games during certain times, *e.g.*, late nights and early mornings to ensure adequate sleep time, or school hours to ensure attendance. Both measures are aimed towards reducing gameplay time rather than in-game spending; nonetheless, the implications of their imposition are insightful. Recently imposed rules in the PRC limit minors' gameplay time to 3 hours on public holidays, including weekends, and 1.5 hours on weekdays.¹³⁵ Curfew laws on online games have been imposed 'between 0:00 and 6:00 in South Korea on juveniles under the age of 16 by Article 26(1) of the Juvenile Protection Act (2011, No. 10659). The PRC restricts minors under the age of 18 from online game services between 22:00 and 8:00.¹³⁶

Such measures are particularly paternalistic as they severely restrict the liberty of the individual, which is likely why they have thus far only been imposed against minors. This suggests that loot box regulation may potentially also need to be applied differently against child and adult players, and against children of different ages. Temporal restriction measures have been documented to cause economic harm against the game industry, and have been argued to even potentially infringe fundamental human rights, 'such as the underage players' right to pursue happiness and self-determination, their parents' right to educate their children and

¹³⁵ NPPA (n 130) art 2.

¹³⁶ *ibid.*

the game companies' freedom of expression.¹³⁷ Stringent loot box (over)regulation may cause similar harms.

Measures restricting gameplay time have also proven difficult to enforce because they are easily circumvented using the personal identification documents of others.¹³⁸ Notably, psychology research has concluded that the South Korean curfew law has been ineffective from a regulatory perspective because it neither reduced adolescent internet usage nor increased adolescent sleeping hours, as were its legislative intent.¹³⁹ This is meaningful for loot box regulation and suggests that more interventionist regulatory 'solutions' (such as banning all paid loot boxes) may not be appropriate without empirical research evidence. Such overregulation fails to protect consumers and harms the industry, and should be avoided. The call for video game companies to be socially responsible by releasing loot box purchase data and cooperating with independent researchers, in order to avoid harmful overregulation, is worth repeating.

4.2.4. An ideal maximum spending limit system as applied to loot boxes

In the Author's view, a universal monthly US\$50 limit may be too low. Considering individual circumstances, a particular player spending US\$100 monthly on the only game that they play every day for many hours may not be unreasonable and should not be restricted. A higher monthly limit of US\$200 per game should be set universally as law to prevent extreme overspending on one particular video

¹³⁷ Xiao and Henderson (n 51) 10–11; citing Byung-gwan Kim, 'Implications of Forced Shutdown in the Fourth Industrial Revolution' (2018) 33 KISO Journal <journal.kiso.or.kr/?p=9248> accessed 21 August 2019.

¹³⁸ Choi and others (n 132) 551–552.

¹³⁹ *ibid* 551.

game. Game companies are welcome to set a lower limit for their games if they deem it more ethical to do so (for example, a game company may voluntarily set a lower monthly US\$30 limit for their child players). This overarching legal limit could then be complemented: individual players' past spending behaviour would be examined in a socially responsible and benevolent manner (rather than malevolently and abusively to derive additional commercial gain¹⁴⁰) to identify potential problematic spenders, then such users are advised as to the potential harms of overspending on loot boxes; provided with resources to participate in support programmes; and, importantly, offered the option to set limits on their own future spending on loot boxes. Ideally, the spending limits of various video games would be organised into one centralised management system using which the player may be able to set individual spending limits on a particular game and also a total spending limit on all games.

Game companies do not necessarily need to implement their own maximum spending limit as a hard cap on spending: instead, the loot box mechanic can be designed to be exhaustive, such that once a predetermined amount of money is spent (*i.e.*, the maximum spending limit), all rewards are guaranteed to be given to (or 'won' by) the player. It is also important to ensure that rewards do not expire or cannot be expended, such that players need not make repeat purchases to obtain the same rewards.¹⁴¹ Game companies can also additionally provide an alternative (reasonably priced) option to buy all possible rewards (or even specific rewards) from the loot box mechanic in a non-randomised manner for a predetermined amount of money. This provides the players with the choice to either engage with

¹⁴⁰ King and others (n 46).

¹⁴¹ King and Delfabbro, 'Video Game Monetization (e.g., "Loot Boxes")' (n 84) 171.

the loot box mechanic for a potential chance to win the most desirable rewards at a discount, or to directly purchase all desired items upfront.

4.3. Disabling cash out features

‘Cash out’ features refer to methods by which in-game items can be transferred between players and thus gain real-world value (e.g., inter-player trading and auction houses). In-game item transfer systems in multiplayer games being misused for money laundering has been well-documented by the media in the PRC.¹⁴² In October 2019, the ability to cash out was disabled globally for *Counter-Strike: Global Offensive (CS:GO)* (2012, Hidden Path Entertainment & Valve Corporation) by the Game’s publisher because ‘worldwide fraud networks have recently shifted to using CS:GO keys to liquidate their gains, [such that] *nearly all* key purchases that end up being traded or sold on the marketplace are believed to be fraud-sourced.’¹⁴³ This may have been done in recognition of potential intermediary liability, as these video game features are facilitating criminality. Additionally, issues of the validity and legality of the transfer of ownership (potentially involving minors with no legal capacity) over decentralised virtual items and currency, whose value may be particularly volatile and subject to little, if any, oversight, also arise.¹⁴⁴

¹⁴² See e.g., 新浪游戏 [Sina Games], ‘网络游戏缘何变“洗钱”平台 [How Online Games Became Platforms for Money-Laundering]’ (*in Chinese*, 5 September 2013) <games.sina.com.cn/y/n/2013-09-05/1116731339.shtml> accessed 31 October 2019; 腾讯游戏 [Tencent Games], ‘团伙网上诈骗百万元 通过游戏账户充值洗钱 [Criminal Gang Committed Million-Yuan Online Fraud and Money-Laundering by Purchasing Microtransactions with Video Game Accounts]’ (*in Chinese*, 26 October 2014) <games.qq.com/a/20141026/016665.htm> accessed 31 October 2019.

¹⁴³ Valve Corporation, ‘Key Change’ (28 October 2019) <blog.counter-strike.net/index.php/2019/10/26113> accessed 31 October 2019 emphasis added.

¹⁴⁴ See Xiao, ‘People’s Republic of China Legal Update: Supreme People’s Court’s Guiding Opinion on Refund Requests Relating to Unauthorised Online Video Gaming Transactions Paid for by Minors (Published 15 May 2020)’ (n 125).

Game companies have complied with the Dutch gambling regulator's requirement to disable cash out features, albeit sometimes unwillingly.¹⁴⁵ The UK and French regulators have also recognised the possible abuse of cash out features, but have yet to act against demonstrable current cases (arguably a failure of their executive function).¹⁴⁶ Considering existing evidence of criminal abuse, there is a substantial public policy reason to subject cash out features to additional regulatory scrutiny. Existing self-regulatory measures that discourage abusing in-game item transfer systems to cash out, such as by telling players not to do so and punishing players caught doing so by banning or restricting their user accounts,¹⁴⁷ are insufficient, because abuse remains factually possible as such measures respond only after the abuses have occurred and after harm has already been caused. Some players would always be willing to risk account termination to cash out. Only the blanket ban of cash out features can completely prevent abuse. Until cash out features can be technologically secured such that they could not be abused, they should not be implemented in new games and should be disabled in existing games.

This is the position that the Dutch regulator has enforced. Therefore, game companies can be reasonably expected to understand how to comply with this regulatory position. The UK and French regulators are also theoretically aligned with this position, although they have not enforced it. Video game companies are in a better position than gambling regulators to understand when and how in-game

¹⁴⁵ *e.g.*, 'While we disagree with this position, we are working to comply with Kansspelautoriteit's current interpretation of these laws.' See 2K Games, 'Statement Netherlands' (n 99).

¹⁴⁶ Xiao, 'Which Implementations of Loot Boxes Constitute Gambling?' (n 1). See text to nn 95–97.

¹⁴⁷ *e.g.*, Electronic Arts (EA), 'Be Safe with FUT Coins and FIFA Points' (4 September 2019) <web.archive.org/web/20200629224510/https://help.ea.com/en/help/fifa/be-safe-with-fut-coins-and-fifa-points/> accessed 29 June 2020; Electronic Arts (EA), 'Know the Rules in EA SPORTS FIFA' (20 September 2019) <web.archive.org/web/20200629224510/https://help.ea.com/en/help/fifa/fifa-rules/> accessed 29 June 2020.

item transfer systems they have implemented may be abused by players. Gambling regulators may not necessarily be able to identify each case easily and promptly. Certain currently non-compliant game companies should act now to disable cash out features; comply with UK and French law; and prevent potential harms to consumers, instead of waiting until the regulators decide to finally enforce the law against them. Similarly, if game companies are willing to comply with Dutch law to better protect consumers in the Netherlands, then they should also responsibly apply the same higher standard of consumer protection to all their consumers in every jurisdiction, rather than merely complying minimally with the law (or, in the case of UK and French law, be non-compliant with the law until it is enforced against them.)

4.3. Ethical game design ‘tool box’: consumer protection measures applied simultaneously

Recognising the practical difficulties with regulating using and enforcing ethical game design measures detailed above,¹⁴⁸ these measures are nonetheless likely to be effective at reducing overspending on loot boxes to an extent and should still be imposed where possible. Pre-commitment limit-setting in gambling contexts only reduces gambling to a limited extent,¹⁴⁹ and maximum spending limits in video games would be difficult to effectively impose compulsorily by regulators in all countries. Therefore, the imposition of any one measure (such as setting maximum spending limits) cannot be perceived as a singular, permanent solution to loot boxes.¹⁵⁰ Multiple measures should be imposed simultaneously. The ineffectiveness

¹⁴⁸ See Xiao and Henderson (n 51).

¹⁴⁹ Harris and Griffiths (n 123).

¹⁵⁰ King and Delfabbro, ‘Loot Box Limit-Setting Is Not Sufficient on Its Own to Prevent Players from Overspending’ (n 38).

of the curfew law in South Korea at reducing internet usage or increasing sleeping hours, and its economic harms, demonstrate that the regulation of technology, particularly video gaming, requires a process of trial and error. The regulation of technology is difficult and its impact unpredictable. Therefore, regulators should experiment with multiple measures simultaneously with the aim of measuring their effects, after being sufficiently informed by empirical research.

Additional ethical game design measures to consider include, amongst others: not offering limited-time-only loot boxes containing unique rewards, so as to not induce an unfair sense of artificial urgency in the player;¹⁵¹ not adopting the pay-to-win model¹⁵² by not offering loot box rewards that provide a competitive advantage;¹⁵³ and ensuring that loot box rewards can also realistically be obtained either through gameplay without payment or through direct (rather than randomised) purchase.¹⁵⁴

For ethical game design to succeed, players and game companies must be accepting of the concept. Xiao and Henderson argued that players may be averse to these measures and perceive them as paternalistic.¹⁵⁵ However, on the contrary, it is especially encouraging that a survey of Norwegian gamblers has demonstrated that

¹⁵¹ King and Delfabbro, 'Video Game Monetization (e.g., "Loot Boxes")' (n 84) 172.

¹⁵² Which leads to 'power-creep' which arguably destroys consumer confidence in the product and is unsustainable from a game design perspective as more and more powerful items need to be created, see Mark Rosewater, 'Why Is Power Creep a Bad Thing?' (*Blogatog*, 31 January 2016) <markrosewater.tumblr.com/post/138448198918/why-is-power-creep-a-bad-thing> accessed 1 September 2019; Sam Stoddard, 'Dealing With Power Creep' (*Magic: The Gathering Official Website*, 9 August 2013) <magic.wizards.com/en/articles/archive/latest-developments/dealing-power-creep-2013-08-09> accessed 31 August 2019.

¹⁵⁵ Xiao and Henderson (n 51) 6–7.

four-fifths of them have a positive attitude towards maximum spending limits, even though it was compulsorily imposed, and that very few actually sought alternative operators after they reached their limit.¹⁵⁶ Therefore, players can be reasonably expected to support these ethical game design measures once they appreciate that these measures are implemented for their protection.

Admittedly, there are practical difficulties with convincing video game companies to voluntarily adopt these measures as many of them are plainly not commercially beneficial as their adoption will negatively impact revenue.¹⁵⁷ A few established game companies have voluntarily implemented some of these principles to a certain degree:¹⁵⁸ for example, *Path of Exile* (2013, Grinding Gear Games) and *Overwatch* only sell loot boxes containing cosmetic items which do not confer competitive advantages, and *Hearthstone* allows the possibility for players to obtain all loot box rewards through gameplay and provides uses for duplicate rewards to ensure that they would still be somewhat useful.¹⁵⁹ There may be certain, albeit limited, potential PR (public relations) benefits to adopting ethical game design, *i.e.*, the media and the public choosing to give recognition and business to certain game companies for their demonstrated social responsibility. For example, video gaming media widely reported on *Fortnite's* implementation of X-Ray Llamas and Epic Game's commitment to 'loot box transparency.'¹⁶⁰ Indeed, public and commercial pressures can encourage ethical game design practices from the industry and ensure

their adoption: consumers should exert pressure by voting with their wallet and choosing to spend their money only on ethically designed video games, and governments should through discretionary grants and tax relief incentivise the cessation of the implementation of potentially abusive game mechanics and the adoption of ethical game design principles.¹⁶¹

The adoption of ethical game design also has the long-term benefit of ensuring that game companies would not seek to invent other potentially abusive mechanics to replace loot boxes after loot boxes become regulated, and thereby force academics and regulators to again scramble to identify the potential harms of another newly invented monetisation method and justify their regulation, whilst exposing consumers to potential harms in the meantime before regulation is finally again made.

4.4. Past instances of minimal compliance by game companies sowed distrust

Voluntary self-regulation is likely the best solution, if all elements of the video game industry can be trusted to comply and endeavour to ensure consumer protection to the best of their abilities. Unfortunately, self-regulation alone as a solution must be treated with scepticism because major game companies have often only acted when explicitly regulated against and have not sought to promote consumer protection to the fullest and uniformly across jurisdictions.¹⁶²

¹⁶¹ Xiao and Henderson (n 51) 12–13.

¹⁶² *ibid* 8–9; Hong (n 101) 79; cf the perspective from the industry, see Kerry Hopkins, ‘Oral Evidence (Questions 1150–1152) to the Immersive and Addictive Technologies Inquiry of the Digital, Culture, Media and Sport Committee of the House of Commons’ (2019) <data.parliament.uk/writtenevidence/committeeevidence.svc/evidencedocument/digital-culture-media-and-sport-committee/immersive-and-addictive-technologies/oral/103191.pdf> accessed 3 August 2020.

Consumers in Belgium are now protected from the potential harms of all paid loot boxes only because of the regulatory action of the Belgian gambling regulator;¹⁶³ consumers in the Netherlands are protected from cash out features, but not from overspending on paid loot boxes that do not contain rewards that are worth real-world money, because of the comparatively more limited regulatory action of the Dutch gambling regulator;¹⁶⁴ and consumers in the UK and France and most other countries remain largely unprotected from cash out features and overspending, because of a lack of substantive regulatory action.

The disclosure of the probabilities of obtaining rewards from loot boxes was initially published only because of the imposition of PRC law and only in Simplified Chinese for the benefits of PRC players.¹⁶⁵ Although the disclosures were often immediately translated into English and published online by dedicated players for the benefits of international players, technically and officially, the disclosures have not been made available to players from non-PRC countries. Game companies have not endeavoured to provide this information as soon as possible to all players in manners most accessible to them, and only complied minimally by providing this information to PRC players.

¹⁶³ e.g., Blizzard Entertainment, 'Paid Loot Boxes and Loot Chests Disabled for Players in Belgium' (*Official Overwatch Forums*, 27 August 2018) <eu.forums.blizzard.com/en/overwatch/t/paid-loot-boxes-and-loot-chests-disabled-for-players-in-belgium/8139> accessed 10 September 2019; 2K Games, 'Statement Belgium' (n 99); Nintendo (n 81).

¹⁶⁴ e.g., 2K Games, 'Statement Netherlands' (n 99).

5. Conclusion: a combined legal and self-regulatory approach to loot boxes

The level of consumer protection provided by game companies often depends on the legal regulation in place, which is why it is necessary for legal regulation to set a minimum acceptable standard to ensure a sufficient degree of consumer protection, in the absence of proactive voluntary self-regulation. The best solution going forward with loot box regulation may be for the law to set a minimum standard that does not overregulate, and for self-regulation to complement the legal regime by thriving to achieve an even higher standard of consumer protection.

In terms of the two types of paid loot boxes, this combined approach would require that the law either prohibit, or regulate as licensed gambling, loot boxes whose rewards are worth real-world money, depending on whether or not gambling is either prohibited or regulated in the jurisdiction, so as to potentially allow video gaming companies to expand into the regulated gambling industry in certain jurisdictions. The combined regulatory approach would ensure that loot boxes whose rewards are worth real-world money cannot be sold to children (which addresses an issue of particular concern to academics; regulators; policymakers; the media; and the public) and that their sale to adults will be strictly scrutinised (and taxed) as gambling by regulators. Cash out features should be restricted by law (which should be strictly enforced) at present until they can be technologically secured, at which point the law may be disapplied and cash out features will be self-regulated as game companies would be in a better position to identify and prevent abuse.

The other type of paid loot boxes, those whose rewards are not worth real-world money, need not necessarily be prohibited or regulated as gambling (and in fact, in the Author's view, should not be). To prevent overspending, a reasonable but considerably high maximum spending limit (which may be set at different values for adults and children, and for children of various ages, and thus should resolve academics'; regulators'; policymakers'; the media's; and the public's particular concern as to children overspending on loot boxes) should be imposed as law, and game companies should be encouraged to complement this legal requirement by restricting player spending further by imposing lower spending limits, or by ensuring that all loot box rewards are guaranteed to be obtained for a predetermined and reasonable amount of money.

To facilitate the adoption of ethical game design, where possible, the law should impose certain ethical game design measures as law: for example, the obligation to disclose probabilities of obtaining rewards. The law should detail a specific and uniform way to communicate such information to players, that is sufficiently prominent and easy to understand, and the law should contain an enforcement regime that is capable of punishing non-compliant game companies. Game companies should be encouraged to improve on the legal requirement by providing additional, even more prominent and easy-to-understand ways for players to access probabilities disclosures. Other ethical game design measures which cannot realistically be codified (because they would require the arguably impossible exercise of subjective discretion by a yet-to-be-established regulatory body¹⁶⁶) should be promoted to game companies through incentives, such as a certification regime, discretionary grants and tax relief. Instead of having a

¹⁶⁶ See Xiao and Henderson (n 51) 11–12.

prospective regulator decide what is ethical game design *per se* and prohibit 'abusive game design,' the video game industry should lead this effort as its members are in the best position to evaluate the 'ethics' of game design. Finally, consumers should be informed of the benefits of ethical game design and encouraged to support only ethically designed video games.
